

4. Passing Primitive

4. Passing Primitive

5. Action Selection

Receding - Horizon:

Motor plans are continuously updated $\rightarrow j(0)$ is the **instantaneous** control.

Human - Directed Jerk:

90% of observation lays in the interval of $\left[-1\frac{m}{s^3}, 1\frac{m}{s^3}\right]$, so we

choose to adopt the solution that presents the value of jerk closer (or belonging) to this interval.

In some cases we need to calculate some new **stop/pass** primitives with $j(0) = 0$.
